1. The SW does mean the notch on the upstream side of the bridge. 40-3 and 40-10 were collected in the same location. Both were collected in the SW corner of the notch, just past the concrete wall for the lift bridge. 40-3 was a sheen net sample and 40-10 was a sediment sample.
2. 40-10 and 40-9 were the only samples collected using the ponar, both were sediment samples collected from the bottom of the canal. Sludge in the case of 40-11, 40-12, and 40-13 refers to the black tar like substance observed in the canal, boom, and bucket. 40-13 was collected in the notch along the SW facing wall.

Thank you Mike. Can I get clarification on location for 40-3, 40-10, and 40-13?

- Specifically, does "SW Corner of Lift Bridge" mean the notch on the upstream side of the bridge?
- And 40-13 says "sludge sample collected from surface of water". What does this mean? I thought all sludge samples came from the ponar dredge and were taken at the bottom of the canal.

Tom and Simonne-

Please find the redacted USCG lab reports. From each file, I have redacted a single page that contains cost documentation. I took the whole page out, because I did not feel the costs were relevant. Please let me know if you have questions.
